# RF wound simulation

minimize the injury under different situation by physic engine

# Goal

We aim to simulate various injury scenarios (such as car accidents, falls from heights, etc.) using a physics engine and enable the model to learn and identify the optimal protective postures.

# Progress

1.Set up simulation environments in unity,(including UI, Character)

2.Connect the Unity project with Python by ML-Agents so that we can easily moditfy the module and reflects the training outcome to the character.

3.Modify the Kits(ML alogrithms), testing the parameters and reward functions.

4.Training and debugging

5.Have fun watching the characters doing weird motion.
